#### Construction

- **Separate blocks to suppress interference between circuits**

The video and power circuits have been separated into two independent blocks within the chassis, and to thoroughly eliminate signal degradation caused by interference between circuits, each circuit has been mounted on its own board. In addition, the top cover features a two-layered construction and the chassis bottom is constructed of three layers to protect the circuits from vibration.

- **Precision Drive Mechanism, a DENON original**

The DVD-2500BT features a unique drive mechanism that DENON newly developed for use with Blu-ray discs. To further protect the internal disc space from magnetic influences, dust, and external noise, DENON improved its mechanism unit from previous DVD players by adding a shield to the bottom and top of the unit to create an ideal playback environment inside. In addition, DENON incorporated its critically-acclaimed Suppress Vibration Hybrid (S.V.H.) loader constructed with a combination of different materials to ensure stable disc rotation and greater accuracy in reading the disc.
